

# GlowProof

## Demo Video Script

2:45 beat-by-beat script, shot list, and sponsor submission notes

---

Target length: **2:45** (satisfies Perfect Corp's 1–3 min cap and Xano's 2–4 min ask in one cut — see VERIFIED.md "Video length"). One take, screen recording + voiceover. Timestamps are cues, not hard marks — pace to the screen, not the clock.

Record with `GLOWPROOF_FORCE_FIXTURE=1` unset for the one real capture (see README "Modes"), or on fixtures if the real capture isn't ready yet — either is honest as long as the on-screen mode badge is visible and never covered by a window/cursor. The badge saying "sample data" openly is better than a real badge implying a claim that isn't backed yet.

---

### 0:00–0:15 — Cold open: the problem

**Screen:** blank, or a quick montage of 2–3 real brand skin-quiz sites

(no need to name them on camera).

**VO:**

Every brand's skin quiz asks you five questions, then maps your answers onto that brand's own shelf. That's not malicious — it's just what happens when the company diagnosing you also sells the cure.

### 0:15–0:35 — The pitch

**Screen:** GlowProof landing page (`v-landing`), full width, mode badge

clearly visible top-right.

**VO:**

GlowProof sells nothing. It measures your skin with a real AI scan from Perfect Corp, then goes looking for what actually fits — on the open market, wherever it's sold. That's a claim only a company with no skincare line to defend can make.

**Action:** click "Scan my skin" (or "Upload a photo" if webcam is unreliable on the recording machine).

### 0:35–1:05 — The scan

**Screen:** capture view → working view (scan line animation, staged

progress: "Uploading over TLS" → "Locating facial landmarks" → "Measuring each concern region" → "Scoring against the reference set").

**VO:**

One photo goes to Perfect Corp's skin analysis API — not a filter, an actual measurement across wrinkles, pores, texture, and acne. The photo itself is never stored — we only keep the scores.

**Action:** let the staged progress play out fully — this is a natural beat, don't rush it in editing.

## 1:05–1:35 — The reveal

**Screen:** results view. Overlay auto-plays through each concern, settles on the worst one. Overall score counts up.

**VO:**

Here's the baseline: an overall score, a plain-language read on each concern, and a visual overlay showing exactly where it was measured. No jargon, no diagnosis — just numbers you can act on.

**Action:** click one or two concern cards manually to show the overlay responds to interaction, not just the auto-play.

## 1:35–2:05 — The routine + real products

**Screen:** scroll to the consultation/routine band. AM/PM steps populate, each with a real product card (thumbnail, price, source).

**VO:**

Claude reads those scores and writes a routine — but it only ever names a product *type* and an active ingredient, never a brand. A separate lookup against live Google Shopping data finds the actual product that satisfies it, at today's real price. Splitting "what you need" from "which product" is what keeps this from just becoming another shelf.

**Action:** hover/click one "buy" product link to show it's a real, priced listing — don't actually navigate away.

## 2:05–2:30 — Xano: it remembers

**Screen:** navigate back to the landing page (or open a fresh tab to `localhost:8000`). The "Recent scans" panel is visible with at least one past scan. Click into it — results repopulate instantly from history.

**VO:**

And unlike a one-off quiz result, this doesn't disappear when you close the tab. Every scan is persisted in Xano — so you can come back days later, pull up your baseline, and actually track whether anything changed.

**Action:** this is the moment that's specifically for the Xano judges — don't rush it, let the click-through play out fully so it's obviously a real round trip, not a mockup.

## 2:30–2:45 — Close

**Screen:** back to landing page, or the disclaimer line on the results band.

**VO:**

GlowProof: measured, not sold to. This is cosmetic guidance, not a diagnosis — if something's changing or painful, see a clinician. Thanks for watching.

---

### Shot list checklist

- [ ] Mode badge visible and legible in every screen segment
- [ ] At least one full concern-overlay cycle shown uninterrupted
- [ ] At least one real product card with visible price + source
- [ ] Recent-scans panel click-through shown in full (Xano beat)
- [ ] Disclaimer/claims-discipline line spoken or shown on screen
- [ ] No cursor covering the badge, scores, or price at the moment they're mentioned in the VO

### Submission notes (write-up, not video)

Both tracks want a short write-up alongside the video:

- **Perfect Corp:** "consumer or retail value" — lead with the bias argument from the README's "The position" section.
- **Xano:** the track is framed as "rebuild a SaaS tool you hate." The honest angle here: GlowProof replaces the *pattern* of a paid, brand-biased skin-quiz backend with a neutral one — Xano holds nothing but scan history, no product catalog, no upsell logic. Say plainly what it replaced (nothing pre-existing, since GlowProof is novel) and why Xano specifically (real persistence without hand-rolling auth/hosting under a one-week deadline).
